Cut and paste text, images, movies, and more in any application with SpeedCut.The present invention relates to a vehicle seat, in particular a front passenger seat, having an adjustment device for at least one seat part, which adjustment device comprises a gas generator and a motor, a transmission gear, which is driven by the motor and which can be coupled with the gear, being arranged between the gas generator and the motor for changing the gear speed in a gear path, wherein a latch is provided for stopping the transmission gear. A vehicle seat of this kind is known from DE 100 20 137 A1. Vehicle seats of this type are used in motor vehicles, in particular in passenger cars. The known vehicle seat allows the inclination of a seat part, which is movable relative to a seat shell, to be varied. For this purpose, the vehicle seat has a gas generator and a motor, the motor being driven by the gas generator. The motor is connected with a transmission gear which meshes with a gear that is arranged between the gas generator and the motor. The transmission gear can be coupled, by means of a coupling, with the gear in such a way that the motor and the transmission gear rotate at the same speed. The motor can be connected with a clutch which engages the transmission gear, and with the clutch, the motor and the transmission gear can be disconnected from one another. The clutch can be connected with a switch
